

INTEGRATED GAS SYSTEM (IGS)

The Integrated Gas System ("IGS") covers a large area west and north of the city of Edmonton, and is comprised of over 525 km of gathering and transmission pipelines, two sour gas plants, three liquids extraction plants, and two transmission compression facilities.

Producers tying gas into the IGS have the option of transporting to their own markets, or selling the gas to ATCO Midstream. The IGS accepts raw or partially processed gas, and operates at a high load factor. Tie-ins to the system can be accommodated in a timely manner and at low cost, due to the IGS' raw gas capability. High availability is the result of our ability to move gas to various plants.

All terms of purchase or transportation agreements are negotiated on an individual basis, and can be tailored to meet each producer's specific requirements.

The IGS provides one-stop service in transporting, processing, and selling of gas.
